

B and fit errors are read directly from ROOT files; lower errors = 100 × fit error / nominal.

Target: $100 \times |B/B_{nominal} - 1| \leq 2.5\%$ in every bin. Green bands retain this target; orange (lower panel) shows nominal $\pm 1\sigma_{stat}$.

Model and ctau settings: fit2d.C. Reference: nominal_bfraction_fwdy.xlsx. Colors show agreement only; validate fit quality separately.
